

Grensloos Pluriform Software that stays forever young

Many companies struggle with old software packages from the past that hinder or at least slow down the digital transition. As a specialist in digital commerce and logistics, Grensloos helps enable and guarantee growth in the areas of e-logistics and e-commerce with Pluriform. Joost Eras from Grensloos shares all the ins and outs of the software, which remains forever young thanks to its unique structure.

Standard where possible, customized where necessary!

Grensloos Pluriform Logistics is a unique ERP application. It is designed in such a way that the strategic advantages of ERP are combined with the benefits of Best of Breed. "Sustainable adaptability is the characteristic that most distinguishes Pluriform from other development methodologies," says Eras.

"By this, we mean being able to quickly realize a new system, then evolve it, and continue to improve it sustainably (for decades), within a short period, and in a manageable way. This makes us a reliable partner that delivers a high-quality system: standard where possible, customized where necessary! Our subscribers will also never experience the system hitting its limits due to the Pluriform approach."

E-logistics & e-commerce software subscription

Grensloos Pluriform is aimed at organizations that want to operate company-wide from a single central information system. This includes producers with both in-house and external production sites, brands, importers & exporters with external production, B2B/C wholesale companies, retail B2C e-commerce parties, and full-service logistics companies. Think of modules for Purchasing, Sales, Accounting, Logistics, Invoicing, and Inventory Management.

Webshops & Customer Services web portal

From existing website(s), we can link to the standard Pluriform Logistics e-commerce web portals, where customers can place orders 24/7. At the same time, they have permanent insight into available and production inventories, current orders, deliveries, and e-invoices. In addition to such integrated webshops, data from the system can also

be accessed for external existing webshops and sites via the Pluriform web service interface. From the Pluriform Order Management System (OMS), all logistics processes, including purchasing logistics, WMS order picking, deliveries, and return processing, are effectively and, where possible, automatically handled.

Purchasing Logistics

Purchasing logistics is a core functionality in Pluriform that automates essential purchasing activities. It supports complex processes such as return processing, additional logistics services, and the handling of both large and small orders. Based on our many years of experience with B2B(retail)/C logistics users, Pluriform Logistics therefore provides an extensive purchasing logistics administration.

Order-driven & project-based production

With Pluriform Logistics production orders, you can easily generate orders per supplier based on order lines. All production modules in Pluriform are developed from practical experience to optimally manage and process production administratively.

Smart communication

Integrated Marketing, CRM, and Sales functionality that seamlessly integrates with key components of the Microsoft 365 Suite. Teams is part of the 'Sales & Operations Planning/E-logistics ERP' application in Pluriform. "This allows professionals to communicate optimally with customers during every contact moment, helping build trust and lifelong customer loyalty." The technology used by Pluriform enables companies that are deeply embedded in their business to quickly expand and optimize their organization.
